

etisalat

Transform legal operations with etisalat agentic AI solution

Legal research and precedent agent

What it does

Researches across thousands of documents, case files, legislation and regulatory frameworks, cross-referencing provisions and identifying relevant precedents. It synthesises findings into structured legal memoranda with full citations, surfacing connections between arguments, facts and provisions that manual review would miss, in minutes rather than weeks.

Business value

- Significantly reduce legal research time with automated multi-document analysis and cross-referencing
- Citation-backed findings, no gaps across large case files
- 24/7 access to key risks, facts and arguments, no waiting on an associate
- Volume that would overwhelm a human team, processed and structured

Real-time compliance and regulatory agent

What it does

Monitors legislative and regulatory changes across every relevant jurisdiction. When something new is published, it assesses the impact on your contracts, policies and compliance documentation, and generates a gap analysis showing what's affected and what needs to change. It can draft the updated language itself and tracks remediation until it's resolved.

Business value

- Regulatory blind spots eliminated, changes caught the day they're published
- Reduce compliance remediation time through proactive gap identification and actionable steps
- Regulatory penalty risk reduced, documents always aligned
- Compliance coverage scales across jurisdictions without scaling headcount

Faster research.
Tighter contracts. Lower risk.

Contract lifecycle agent

What it does

Automates the full contract lifecycle, from drafting through execution and beyond. It generates contracts from your template library, routes them through approval and flags risky clauses and deviations from your preferred terms. After signing, it extracts obligations, deadlines and renewal dates and keeps the whole portfolio searchable, so any clause or term can be found instantly.

Business value

- Reduce contract cycle time with automated drafting, review and approval workflows
- Contract risk mitigated through automated clause and deviation flagging
- No missed deadlines; obligations and renewals tracked automatically
- Instant search across your entire portfolio, any clause, in seconds

Predictive litigation and risk agent

What it does

Analyses historical case outcomes, opposing counsel patterns, judicial tendencies and jurisdictional trends to forecast litigation outcomes and settlement ranges. It builds risk scores quantifying the expected value of trial versus settlement, identifies patterns in how specific judges rule and how opposing counsel argue and recommends a resolution strategy for informed go/no-go decisions.

Business value

- Litigation strategy backed by historical patterns, not gut feel
- Settlement decisions quantified, know when to fight and when to settle
- Reduce external legal spend through better-informed case strategy and earlier dispute resolution
- Risk quantification that the general counsel and board can rely on
